Fri 17 Jul 2026 16:34:21 - sa_sadmin_prepare.sh v03.31.01 - Library v04.92.05

Desc: Describe what your program is doing.

bilbo.maison.ca - User: root - Umask : 0002 - Arch: x86_64

Fedora Linux v43 - Kernel 7.1.3-101.fc43.x86_64 - SADMIN(C): /opt/sadmin

=====

01) SADMIN Bash Library Functions Available To Developers

=====

[001]	\$(sadm_get_release)	SADMIN Release Number (XX.XX)	: 2.1.2
[002]	\$(sadm_get_ostype)	OS Type (Uppercase,LINUX,AIX,DARWIN)	: LINUX
[003]	\$(sadm_get_osversion)	Return O/S Version (Ex: 7.2, 6.5)	: 43
[004]	\$(sadm_get_osmajorversion)	Return O/S Major Version (Ex 7, 6)	: 43
[005]	\$(sadm_get_osminorversion)	Return O/S Minor Version (Ex 2, 3)	:
[006]	\$(sadm_get_osname)	O/S Name (REDHAT,CENTOS,UBUNTU,...)	: FEDORA
[007]	\$(sadm_get_oscodename)	O/S Project Code Name	: n/a
[008]	\$(sadm_get_username)	Current User Name	: root
[009]	\$(sadm_get_kernel_version)	O/S Running Kernel Version	: 7.1.3-101.fc43.x86_64
[010]	\$(sadm_get_kernel_bitmode)	O/S Kernel Bit Mode (32 or 64)	: 64
[011]	\$(sadm_get_hostname)	Current Host Name	: bilbo
[012]	\$(sadm_get_host_ip)	Current Host IP Address	: 192.168.1.22
[013]	\$(sadm_get_domainname)	Current Host Domain Name	: maison.ca
[014]	\$(sadm_get_fqdn)	Fully Qualified Domain Host Name	: bilbo.maison.ca
[015]	\$(sadm_server_serial)	Server serial number (Ex: 4S7GYF1)	: E537F839
[016]	\$(sadm_server_cpu_speed)	Server CPU Speed in MHz	: 3000 MHz
[017]	\$(sadm_server_nb_cpu)	Number of Physical CPU on system	: 1
[018]	\$(sadm_server_nb_logical_cpu)	Number of Logical CPU	: 4
[019]	\$(sadm_server_core_per_socket)	Number of Core per Socket	: 2
[020]	\$(sadm_server_thread_per_core)	Number of Thread per Core	: 2
[021]	\$(sadm_server_nb_socket)	Number of socket on system	: 1
[022]	\$(sadm_get_packagetype)	Get package type (rpm,deb,aix,dmg)	: rpm
[023]	\$(sadm_server_arch)	System Architecture	: x86_64
[024]	sadm_lock_system "hostname"	Lock the specified hostname	: 0=Lock 1=Could not lock
[025]	sadm_lock_status "hostname"	Check if specified hostname is lock	: 0=Not Lock - 1=System Locked
[026]	sadm_unlock_system "hostname"	Unlock the specified hostname	: 0=Unlocked 1=Error could not unlock
[027]	sadm_write_log "message"	Write message to Screen, Log or Both:	message
[028]	sadm_write_err "message"	Write message to error log + std log:	message
[029]	sadm_sendmail(mail,sub,body,att)	Send email (attachment optional)	: 0=Sent 1=Could not send
[030]	sadm_silentremove 'filename'	Delete a file silently	: 0
[031]	sadm_trimfile "filename" 35	Keep the last 35 lines of filename.	: 0=Success 1=Error
[032]	sadm_sleep "60" "15"	Sleep 60sec. at interval of 15sec.	: 60...45...30...15...0
[033]	\$(sadm_get_epoch_time)	Get Current Epoch Time	: 1784320463
[034]	\$(sadm_epoch_to_date 1784320463)	Convert epoch time to date	: 2026.07.17 16:34:23
	WDATE='2026.07.17 16:34:23'		
[035]	\$(sadm_date_to_epoch "\$WDATE")	Convert Date to epoch time	: 1784320463
	DATE1='2016.01.30 10:00:44' DATE2='2016.01.30 10:00:03'		
[036]	\$(sadm_elapse "\$DATE1" "\$DATE2")	Elapse Time between two timestamps	: 00:00:41
[037]	sadm_show_version	Cmdline '-v' this func. is called	:

02) SADMIN Section of your program that is shared with SADMIN Bash Library.

```
=====
[001] $$ADM_TPID                Script Process ID.                : 368911

[030] $$ADM_ALERT_REPEAT        0=NoAlertRepeat, Repeat every sec. : 0 Sec.
[031] $$ADM_MAIL_ADDR           Email Address of SADMIN SysAdmin    : brucetalbot95@gmail.com
[032] $$ADM_MAX_LOGLINE         Nb of Lines to trim (0=NoTrim)      : 500 lines.
[033] $$ADM_MAX_RCHLINE         Nb of Lines to trim (0=NoTrim)      : 30 lines.
```

3) Summary of the 'sadm_start()' and 'sadm_stop()' functions in SADMIN Bash Library

'sadm_start()' - Bash Library Function

The 'sadm_start()' function basically initialize the SADMIN environment.
When you call 'sadm_start()', it will only come back to caller if everything went OK.
Otherwise, it will advise the user of the error and exit(1).

Summary of the parts that 'sadm_start()' perform :

- 1) Step one, make sure all \$SADMIN directories & sub-dir. exist and have proper permissions.
- 2) If \$SADM_LOG_APPEND='N', create new log & error log or append to existing log.
- 3) If \$SADM_LOG_HEADER='Y', Include or not the script header in the log [Y/N].
- 4) If \$SADM_ROOT_ONLY='Y', The script can only be run by 'root' user [Y/N].
If user is not 'root', we advise the user and exit(1).
- 5) If \$SADM_SERVER_ONLY='Y', and not on the SADMIN server, show error message and exit(1).
- 6) If \$SADM_GROUP_ONLY='Y', and the user is not part of the SADM_GROUP (unless 'root'),
show error message and exit(1).
- 7) If \$SADM_USE_RCH='Y', write starting time to the RCH file (With a code 2=Running).
- 8) If system is lock and running on the SADMIN server, issue message and exit(1)
- 9) If PID file '\$SADM_PID_FILE' exist and '\$SADM_MULTIPLE_EXEC='Y'', continue normal execution
If PID file exist and execution time (sec) is less than the '\$SADM_PID_TIMEOUT', show error message and exit(1).
If PID file exist and execution time (sec) exceed the '\$SADM_PID_TIMEOUT' a new '\$SADM_PID_FILE' is created
and execution is resume.

Notes: If any unrecoverable error occurs while executing 'sadm_start()', it will advise
the user of the error and exit(1). See example in '/opt/sadmin/bin/sadm_template.sh'.

'sadm_stop(exit_code)'

The adm_stop(exitcode) basically collect and write information in log and in 'rch' file.

Summary of the parts that 'sadm_stop()' does :

- 1) Calculate execution Time.
- 2) If Y='Y', update the rch file (End Time & Elapse Time ...).
- 3) Validate the alert group,
- 4) If Y='Y', write the log footer.
- 5) If the error log file is empty, then delete it.
- 6) Delete the PID file (/opt/sadmin/tmp/sa_sadmin_prepare.368911) of the program.
- 7) Close log and error log files.
- 8) If 500 is not zero, trim the log according to user choice in '500'.
- 9) If is not zero, trim the 'rch' according to user choice in 'SADM_MAX_RCLINE'.
- 10) Set permission and owner/group to log and rch files.
- 11) If on the SADMIN server, then rch and log are immediatly web central directory.

Notes: This should be the one of the last function called at the end of your program.
See example in '/opt/sadmin/bin/sadm_template.sh'.

4) Variables Available reflecting values from SADMIN configuration file.
